A small, but growing, movement is trying to find a way to deal with the problem of *diabetes** in the United States. This movement is made up of special programs, doctors, hospitals and health officials that are (①) about increasing evidence that (A) [people / in the United States / the food system is / sick / making]. The food system has made it easier and less costly for people to eat too many *processed foods**.

A Reuters news agency report suggested that diabetes represents a major public health failure in the United States. The number of Americans with the disease has grown quickly in recent decades even though (②) on new treatments has increased as well.

Diet, or the foods that people eat, plays an important part in the life and health of people with diabetes, yet it is rarely dealt with in the U.S. *healthcare system**. Government programs, *insurers** and medical providers spend billions of dollars on costly *medications**, *operations** and *medical devices** to (③) patients.

Devon Klatell is the Rockefeller Foundation's managing director of food initiatives. Klatell said that the U.S. has not spent enough time and effort in food and nutrition within the healthcare sector. She added, "There is *overwhelming** evidence that our food system is making lots of us sick."

Poor diets, along with less active lifestyles, are directly linked to type 2 diabetes, the most common form of the disease. Highly processed foods full of sugars and fats play a part in the high blood sugar levels and obesity that often lead to type 2. Of the estimated 34 million Americans with diabetes, about 95 percent are type 2. About 1.6 million Americans have type 1 diabetes, an *autoimmune** disease of unknown cause that (④) lifelong *insulin shots**.

Unlike type 1 patients, those with type 2 diabetes may be able to manage or (⑤) the *severity** of their illness through diet and exercise, greatly reducing the risk of very bad health problems.

(B) With the right diet, some may even be able to live without medication.

A small number of special programs seek to make it easier for patients to eat right. These programs take many forms. In Pennsylvania, doctors write diabetes patients *prescriptions** for healthy food to be filled at food pharmacies* that look like small grocery stores. In Santa Barbara, California, a clinic offers bags of fresh food every week to dozens of diabetes patients.

Scientists have long said getting a good night's sleep is important to your health. The U.S. National Institute of Health says lack of sleep may even increase the risk of *impaired** brain activity, or *cognitive decline**, and *Alzheimer's disease**.

Now, an American team of scientists reports that too much sleep might be similarly linked to such conditions. Researchers at Washington University School of Medicine did the sleep study. The study examined 100 adults who had been under medical observation for cognitive ability, the ability to (①), for an average of 4.5 years. The average age of the study subject was 75. Eighty-eight of the group had been identified as free of cognitive impairment, or damage. Eleven subjects were judged very mildly impaired, and one was identified as mildly impaired.

During the study, they were asked to complete several tests for signs of cognitive decline. The tests are combined into a cognitive score – the higher the score, the better. They also wore *EEG devices** for four to six nights to (②) their brain activity during sleep. Overall, cognitive scores declined for the groups that slept less than 4.5 hours or more than 6.5 hours per night — as measured by EEG. But the scores (③) the same for those in (A)the middle of the range.

Dr. Brendan Lucey is director of the Washington University Sleep Medicine Center and (④) the research. He said, “Our study suggests that there is a middle range, or ‘sweet spot,’ for total sleep time” for best cognitive performance. “Short and long sleep times were *associated** with worse cognitive performance, perhaps due to *insufficient** sleep or poor sleep quality,” Lucey added.

Greg Elder is a sleep researcher at Northumbria University in New Castle, Britain. He was (⑤) about the findings that (B)6.5 hours / cognitive decline / linked / sleeping / longer / was / with / than]. He said “this is low when we consider that older adults are recommended to get between seven and eight hours of sleep every night.” Elder also noted that the research did not consider other information about the individuals studied, including their general health or economic conditions.
